Accuracy note: This is a prepared prompt/implementation log, not a verbatim ChatGPT interface export. Attach the actual platform export or share link separately if required.

Task 1 - Cubic Bezier fix

Prompt: Compare bezier() with the standard cubic formula and correct the mistaken middle term. Decision: corrected 3*u*t*p2 to 3*u*t**2*p2 for x and y. Check: endpoint and midpoint-weight tests passed.

Task 2 - Enemy tint

Prompt: Add later-wave palettes while preserving wave-1 defaults and safe fallback. Decision: wave 1 returns None; subsequent waves cycle through three RGB palettes; unknown kinds return None. Check: tested default, wave-2, and unknown-kind cases.

Task 3 - Wave banner

Prompt: Show a short WAVE n banner when each wave spawns. Decision: on_wave_start stores wave and label and starts a 1.5-second timer; update decrements it and draw displays it. Check: wave, label, and timer test passed.

Task 4 - Shield charges

Prompt: Give one shield hit every third wave and none otherwise. Decision: shield_charges returns 1 on positive multiples of 3 and 0 otherwise. Check: tested waves 1 through 9.

Final verification and remaining evidence

Five focused unit tests passed and Python source compiled during local validation. Install Pygame and play the game on the target machine. Genuine 10-second before/after screen recordings and the actual platform chat export/share link still need to be attached. Generated preview videos are not screen-recording evidence.
